$x_{1}(t)=\left\{\begin{array}{cc}|t|, & -1 \leq t \leq 1 \\ 0, & \text { otherwise }\end{array}\right.$
$x_{2}(t)=\left\{\begin{array}{cc}1-|t|, & -1 \leq t \leq 1 \\ 0, & \text { otherwise }\end{array}\right.$
These signals are sampled with a sampling period of $T=0.25$ seconds to obtain discrete-time signals $x_{1}[n]$ and $x_{2}[n]$, respectively. Which one of the following statements is true?
(A) The energy of $x_{1}[n]$ is greater than the energy of $x_{2}[n]$
(B) The energy of $x_{2}[n]$ is greater than the energy of $x_{1}[n]$
(C) $x_{1}$ and $x_{2}[n]$ have equal energies
(D) Neither $\mathrm{x}_{1}[\mathrm{n}]$ nor $\mathrm{x}_{2}[\mathrm{n}]$ is a finite energy signal.

Answer: (A)
49. The figure shows two buck converters connected in parallel.

The common input dc voltage for the converters has a value of 100 V . The converters have inductors of identical value.

The load resistance is $1 \Omega$. The capacitor voltage has negligible ripple. Both converters operate in the continuous conduction mode. The switching frequency is 1 kHz , and the switch control signals are as shown. The circuit operates in the steady state. Assuming that the converters share the load equally, the average value of $\mathrm{i}_{11}$, the current of switch S 1 (in Ampere), is $\qquad$ (up to 2 decimal places).
